

1.0 Station history of The Gambia Meteorological Network & rainfall stations

The Gambia Meteorological service used to operate fifteen (15) Network stations covering all the regions in the country, but these was reduced to ten (10) in 2008. As of now, the department operates 10 synoptic weather stations and 25 rainfall stations as shown in table 1.2.

1.1 Network of Meteorological and Rainfall stations

Figure 1 shows Network of Meteorological stations in black symbols, 24 hour stations in blue symbols and red symbols for stations closed in 2008. The green symbols are the proposed new stations in 2014.

1.2.1 Rainfall distribution

Rainfall amount ranging between 52 to 78 mm was recorded over the greater part of the country with a highest of more than 104mm over Sapu in the Central River region. The lowest record ranging between 0 to 26mm prevailed over Banjul. The country average seasonal rainfall during October-November-December stood at 58.9mm, 27% below the long term mean (220.4mm) of 1981-2010.

2.0 Part V: Climate Report explanations

PREFACE

Selected climatological data of general importance from weather stations in the Gambia has been compiled in this report. The values have been checked. Blank spaces indicate either missing or delayed records. If data are missing one or several days for one station within the selected period, this station are marked with an asterisk (*). Observed values (OBS) and the normals (NORM) of these data values from the long period averages are given for the following elements :

- Average air temperature
- Rainfall
- Relative Humidity
- Sunshine
- Interpolated map for rainfall is included.

EXPLANATION OF TABLES

- Rainfall (mm) amount is measured every six hours in a standard rain gauge 100cm above ground level. The Total rainfall amount for any given day is the cumulative or accumulated six hourly rainfall amounts. A Rainy day is defined as a day with a total rainfall amount equal or more than 1mm.
- Air Temperature (°C) observations are made from thermometers exposed in Stevenson Screens, 1.25 metres above the ground. The Maximum and Minimum Temperature (°C) observed/ obtained, indicates the highest and lowest temperatures during the specified period.
- Relative Humidity is derived from the readings of the dry and wet bulb thermometers and expressed in Percentage (%).
- Sunshine Duration is measured using a Campbell-Stokes Tropical Sunshine Recorder and is recorded in hours.
- Actual Evaporation is determined from a Class A Pan and measured in millimetres (mm).
- Wind speed per day is read from a Cup Counter Anemometer mounted 10 metres above the ground and read in knots. It can also be converted to metres per second (m/s) or kilometer per hour (km/h).

Abbreviations :

- MeanT : Mean Temperature
- Mean Tmax : Mean Maximum Temperature
- Mean Tmin : Mean Minimum Temperature
- AbTmax : Absolute Maximum Temperature
- AbTmin : Absolute Minimum Temperature
